

## Epoxy Floor Coating Problem Solving Guide

### Yellowing

#### **Description:**

The epoxy has developed a yellow or amber hue. This will affect both clear and pigmented epoxies.

#### **Cause:**

Sunlight: Epoxies, when exposed to sunlight- direct or partial, will amber or yellow.

#### **Repair:**

- Remove any dirt, grease or oil by cleaning with appropriate cleaning agent.
- Dull the surface using a diamond grinder or other mechanical method. Then remove dust.
- Reapply coating per directions.

#### **Prevention:**

- When using a decorative vinyl flake system, use a *full flake* system. Remember to apply a UV stable, clear, urethane topcoat.
- When using a solid color, use a UV stable, clear, urethane topcoat. This will not prevent yellowing entirely but will hinder it. You may also wish to use a pigmented urethane topcoat.
